SALESFORCE ADMIN COURSE

EPISODE 12 • STUDY NOTES

Lightning Pages in Salesforce Home, App & Record Pages + Lightning App Builder

A complete, easy-to-revise breakdown of the video — with tables, multiple diagrams, and step-by-step build guides.

WHAT'S INSIDE

- What are Lightning Pages
- Lightning App Builder
- Creating each Page type
- Page Layout vs Lightning Page
- Home / App / Record Pages
- Activation options

YouTube Companion Notes

Duration Covered: 00:00 – 18:00

1 Introduction 0:00 – 0:45

After Compact Layouts and the Highlights Panel, today we cover one of the most powerful customization features for Salesforce Admins: **Lightning Pages**.

> **Covered today:** What Lightning Pages are • Page Layouts vs Lightning Pages • Lightning App Builder • the 3 page types (Home, App, Record) • building each one • activating them.

2 What are Lightning Pages? 0:45 – 2:30

Before Lightning Experience, admins could only control which *fields* appeared, using Page Layouts — the page itself couldn't be redesigned. Lightning Pages changed that.

IN SIMPLE WORDS

Lightning Pages control the complete design and user experience of a page

A Lightning Page Lets You Decide...

- Which components appear
- Where they appear
- Which users see them
- Which Apps use them
- Which Record Types use them

3 Page Layout vs. Lightning Page 2:30 – 4:00

This is where many beginners get confused — but one line clears it up completely, and it's worth remembering for your entire Salesforce journey.

REMEMBER THIS

Page Layout decides WHAT users see.
Lightning Page decides HOW users see it.

Page Layout Controls

- Fields
- Related Lists
- Buttons
- Actions

→ *What information users can access*

Lightning Page Controls

- Overall page design
- Component placement
- Tabs, Dashboards, Charts
- Flow, Rich Text, Custom Components

→ *How the page is designed & experienced*

Visual: WHAT vs. HOW

4 Lightning App Builder 4:00 – 5:30

Lightning Pages are built using the **Lightning App Builder** — a drag-and-drop tool that requires zero code.

> **Lightning App Builder** = a visual, drag-and-drop builder for admins to design Lightning Pages without writing a single line of code.

Components You Can Drag & Drop

Related Lists | Reports | Dashboards | Tabs | Rich Text | Flow | Chatter | Custom Lightning Components

5 Types of Lightning Pages 5:30 – 8:30

Salesforce provides **three** types of Lightning Pages, each with a different purpose.

🏠 Home Page

The first page users see after logging into Salesforce.

Can Include	Purpose
Dashboards	At-a-glance business metrics
Assistant	Suggested next actions
Today's Events	Daily calendar snapshot
Recent Records	Quick access to recent work
Rich Text / Reports	Announcements, key numbers

Different users or profiles can even see different Home Pages.

📱 App Page

A standalone page inside a Salesforce App — **not tied to any specific record**.

Typically Used For
Dashboards
Reports & Charts
Utility Components
Company Announcements

Example: a "Sales Dashboard" page living inside the Sales App.

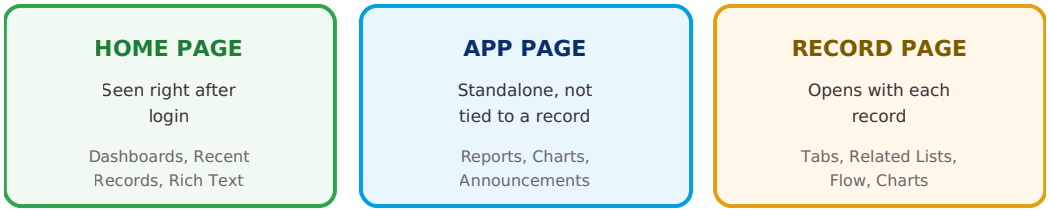

📄 Record Page

Displayed whenever a user opens a record — Account, Contact, Student, Opportunity, etc.

Admins Can Customize
Component positions
Tabs & Related Lists
Charts, Flow, Rich Text
Custom Components

This is the Lightning Page type Admins work with most often.

The Three Page Types at a Glance

6 Practical Demo: Building All 3 Pages 8:30 – 15:00

Step 1 — Create a Home Page

1. Go to **Setup** → search **Lightning App Builder**.
2. Click **New** → choose **Home Page**.
3. Give it a name.
4. Drag a **Dashboard** component onto the page.
5. Add **Recent Records** and **Rich Text** components.
6. Click **Save**.

Step 2 — Create an App Page

1. Click **New** again → choose **App Page**.
2. Name it **Sales Dashboard**.
3. Add **Report Chart**, **Dashboard**, and **Rich Text** components.
4. Click **Save**.

Step 3 — Create a Record Page

1. Click **New** → choose **Record Page**.
2. Select the **Student** Object.
3. Add **Related Lists**, **Tabs**, **Rich Text**, and **Report Chart** components.
4. Arrange them using drag-and-drop.
5. Click **Save**.

> **Tip:** All three page types are built inside the *same* Lightning App Builder tool — only the page type you select at the start changes what's available to configure.

7 Activating Lightning Pages 15:00 – 17:00

Creating a Lightning Page isn't enough on its own — it also needs to be **activated** to go live. Click **Activate**, and choose from three options:

1. Org Default

The page becomes the default for the **entire organization** — every user, every app, sees this page.

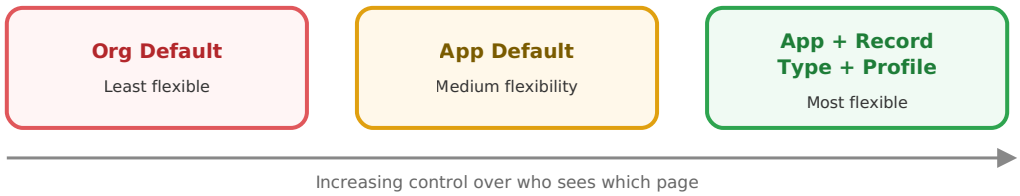

2. App Default

The page is used only **inside a specific App** — other Apps keep their own default page.

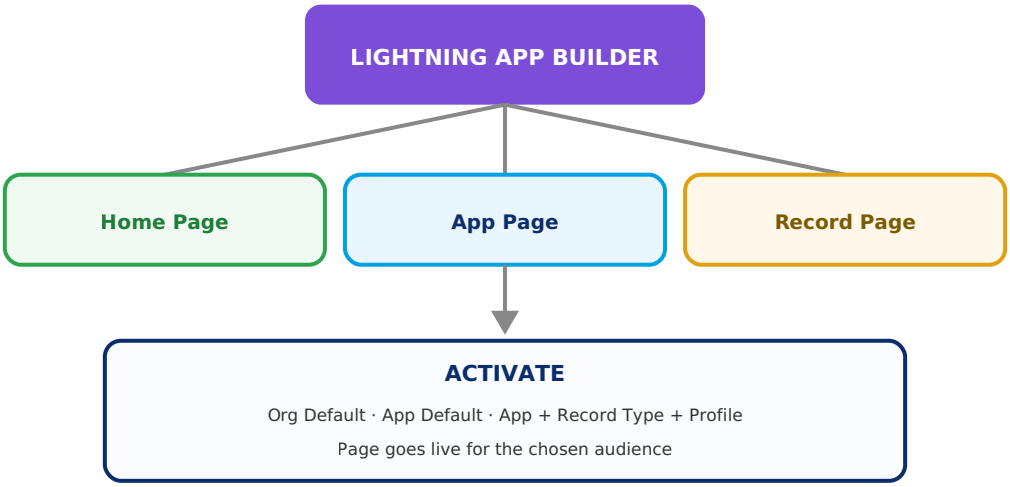

3. App, Record Type & Profile

The **most flexible** option. Assign different Lightning Pages based on a combination of App, Record Type, and Profile — so different users get completely different experiences for the same object.

Activation Options — Flexibility Scale

8 Full Lightning Page Ecosystem — Recap Diagram

9 Episode Summary 17:00 – 18:00

- ✔ Lightning Pages control the **full design and experience** of a page — built via the Lightning App Builder
- ✔ Page Layout = WHAT users see | Lightning Page = HOW they see it
- ✔ Three page types: **Home Page**, **App Page**, **Record Page** — each with a distinct purpose
- ✔ How to build each type step-by-step in the Lightning App Builder
- ✔ Three activation options: Org Default, App Default, and App + Record Type + Profile (most flexible)
