SALESFORCE ADMIN COURSE

EPISODE 13 • STUDY NOTES

Dynamic Forms in Salesforce Field Visibility & Dynamic Forms vs Page Layouts

A complete, easy-to-revise breakdown of the video — with tables, multiple diagrams, and a step-by-step build guide.

WHAT'S INSIDE

- What are Dynamic Forms
- Why they were introduced
- Dynamic Forms vs Page Layouts
- Field Section Component
- Field Visibility
- Component Visibility

YouTube Companion Notes

Duration Covered: 00:00 – 15:00

1 Introduction 0:00 – 0:40

After Lightning Pages, here's a natural follow-up question: what if you want to show or hide **individual fields** based on conditions — without creating multiple Page Layouts? That's exactly what **Dynamic Forms** solve.

> **Covered today:** What Dynamic Forms are • Why they were introduced • Dynamic Forms vs Page Layouts • Field Section Component • Field Visibility • Component Visibility • Full practical demo

2 What are Dynamic Forms? 0:40 – 2:30

Take a Student record. If the status is **Regular**, we want to show Classroom, Section, and Roll Number. If it's **Distance Learning**, we want Study Center and Online Portal ID instead.

Status = Regular	Status = Distance Learning
Classroom	Study Center
Section	Online Portal ID
Roll Number	—

With traditional Page Layouts, this usually needs **multiple Page Layouts + Record Types**. Dynamic Forms make it far simpler.

IN SIMPLE WORDS

Dynamic Forms let you display the right fields to the right users at the right time

3 Why Were Dynamic Forms Introduced? 2:30 – 4:00

✖ Before Dynamic Forms

Admins had to create **multiple Page Layouts** and assign them through Record Types. This worked, but became hard to maintain as requirements grew.

✔ After Dynamic Forms

Field-level visibility is configured **directly inside the Lightning App Builder** — no extra layouts or record types needed for many scenarios.

Key Benefits

- Better user experience
- Less scrolling
- Cleaner record pages
- Easier maintenance
- Fewer Page Layouts needed

4 Dynamic Forms vs. Page Layouts 4:00 – 6:00

Interview tip: This comparison is one of the most commonly asked Salesforce Admin interview questions.

Page Layout

- Controls fields for the **entire object**
- Less flexible
- Often needs Record Types for variation
- Changes affect **all users** on that layout

Dynamic Forms

- Controls **individual fields** and sections
- Much more flexible
- Supports conditional visibility
- Built directly in Lightning App Builder
- Personalized experience, fewer layouts

Quick Memory Trick

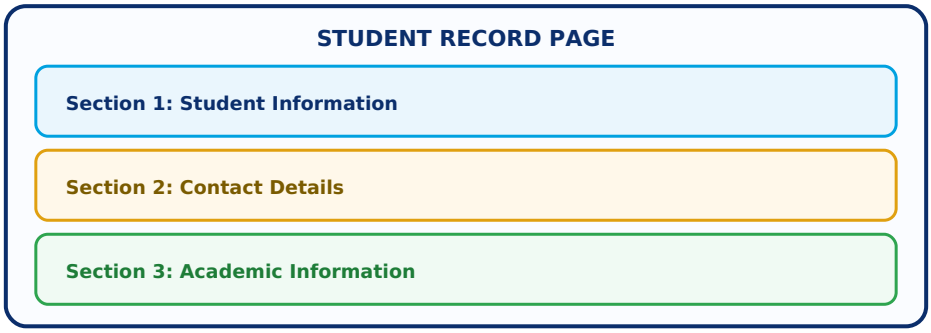
PAGE LAYOUT
= STATIC

DYNAMIC FORMS
= DYNAMIC

5 Field Section Component 6:00 – 7:30

Dynamic Forms introduce a new component: **Field Section**. Instead of the traditional Record Detail component, you drag Field Sections onto the page and place fields exactly where you want.

Example: Splitting a Student Page into Sections



Each Field Section is an independent block — giving you complete control over the page's design.

6 Field Visibility 7:30 – 9:30

One of the biggest advantages of Dynamic Forms: you decide **when a field should appear**, based on a condition.

Field	Shown Only When...
Scholarship Amount	Scholarship = Yes
Vehicle Registration Number	Vehicle Type = Used

> Users only see fields relevant to them — keeping the page clean and easy to use.

7 Component Visibility 9:30 – 10:30

Dynamic Forms extend this same idea beyond fields — **entire components** can be shown or hidden based on conditions.

Example 1 — Report Chart

Show a Report Chart component **only for Managers**.

Example 2 — Rich Text Announcement

Show a Rich Text announcement **only for Sales users**.

Example 3 — Flow

Show a Flow component **only when a record reaches a specific status**.

Together, Field Visibility + Component Visibility create a highly personalized Lightning experience for every type of user.

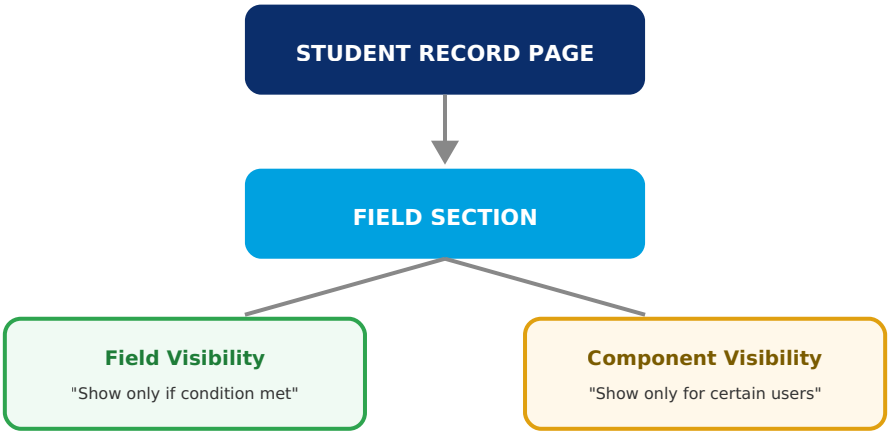
8 Practical Demo 10:30 – 14:00

Let's configure Dynamic Forms on the **Student** Record Page.

1. Open the **Student Record Page** → click **Edit Page** (opens Lightning App Builder).
2. Remove the **Record Detail** component.
3. Drag a **Field Section** onto the page and add the required fields.
4. Create another **Field Section** for Academic Details.
5. Select a field → open **Set Field Visibility**.
6. Create a condition, e.g. **Status equals Distance Learning**.
7. Click **Save**, then **Activate** if needed.

Result: Open different Student records — different fields appear automatically based on the conditions configured. That's the power of Dynamic Forms.

9 Dynamic Forms — Full Flow Recap Diagram



10 Episode Summary 14:00 – 15:00

- ✔ Dynamic Forms let you show the **right fields to the right users** without extra Page Layouts
- ✔ Introduced to solve the maintenance problem of multiple Page Layouts + Record Types
- ✔ Page Layout = Static (whole object) | Dynamic Forms = Dynamic (individual fields)
- ✔ Field Section component replaces Record Detail for full layout control
- ✔ Field Visibility controls individual fields; Component Visibility controls whole components
- ✔ Both are configured with simple conditions directly in Lightning App Builder
