SALESFORCE ADMIN COURSE

EPISODE 16 • STUDY NOTES

Schema Builder in Salesforce Create Objects, Fields & Relationships Visually

A complete, easy-to-revise breakdown of the video — with tables, diagrams, and a step-by-step build guide.

WHAT'S INSIDE

- What is Schema Builder
- Why we use it
- Key features
- Creating Objects
- Creating Fields
- Creating Relationships

1 Introduction 0:00 – 0:40

So far, we've created Objects, Fields, and Relationships individually. But what if you want to see your **entire Salesforce data model** on one screen — or build everything without hopping between setup pages? That's exactly what **Schema Builder** does.

> **Covered today:** What Schema Builder is • Why we use it • Its features • Creating Objects, Fields & Relationships visually • A full practical demo

2 What is Schema Builder? 0:40 – 2:20

Imagine building a school management system with objects like Student, Course, Teacher, and Enrollment. Instead of opening each object one by one, wouldn't it be easier to see them **all together**?

IN SIMPLE WORDS

Schema Builder is a drag-and-drop visual tool used to view, create, and manage objects, fields, and relationships

It displays objects and their relationships as a diagram, making it far easier to understand how your data is connected.

3 Why Do We Need Schema Builder? 2:20 – 3:40

As a Salesforce org grows, it accumulates many custom and standard objects — managing them one at a time becomes difficult. Schema Builder helps by:

- Showing all objects visually
- Displaying relationships between objects
- Creating objects & fields from one screen
- Understanding the complete data model
- Making application design faster and easier

Bottom line: Schema Builder saves time and keeps Salesforce customization far more organized.

4 Features of Schema Builder 3:40 – 5:30

- ✔ Visual representation of the entire data model
- ✔ Create Custom Objects
- ✔ Create Custom Fields
- ✔ Create Lookup and Master-Detail Relationships
- ✔ View Standard and Custom Objects together
- ✔ Zoom in, zoom out, and rearrange objects
- ✔ Understand object relationships without opening each object separately

5 Practical Demo 5:30 – 10:30

Step 1 — Open Schema Builder

1. Go to **Setup**.
2. Search for **Schema Builder**.
3. Open it — you'll see a canvas where objects are displayed.

Step 2 — Display Objects

1. From the left panel, select the objects you want to display — e.g. **Student**, **Company**, **Application**, **Interview**.
2. All selected objects appear visually on the canvas.
3. Drag and arrange them however you like.

Step 3 — Create a Custom Object

1. Click **Elements** → select **Object**.
2. Drag it onto the canvas.
3. Enter Object Label, Plural Label, Record Name, and Data Type.
4. Click **Save** — the object is created instantly.

Step 4 — Create a Custom Field

1. Select **Field** from the Elements panel.
2. Choose a field type: **Text**, **Number**, **Picklist**, or **Date**.
3. Drag it onto the **Student** object.
4. Enter the field details and save — the field is created immediately.

Step 5 — Create a Relationship

1. Select **Lookup Relationship** or **Master-Detail Relationship**.

2. Drag it from one object to another.
3. Configure the relationship and click **Save**.
4. A line now connects both objects, representing the relationship visually.

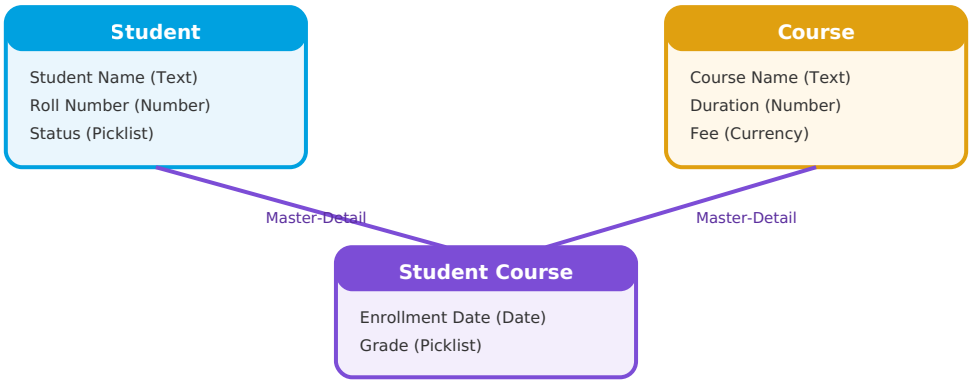
Step 6 — Explore the Data Model

1. Zoom in and zoom out on the canvas.
2. Move objects around freely.
3. See how all relationships are understandable from a single screen.

> **Why it matters:** This single-screen view is exactly why Schema Builder shines on large Salesforce projects.

6 Schema Builder Canvas — Visual Mockup

Here's roughly what a small data model looks like once built out in Schema Builder:



Whole data model — objects, fields, and relationships — visible at once

7 When Should You Use Schema Builder? 10:30 – 11:30

- Designing a new application
- Understanding an existing data model
- Creating multiple objects quickly
- Explaining relationships to clients or team members
- Documenting your Salesforce architecture

8 Episode Summary 11:30 – 12:00

- ✔ Schema Builder = a **visual, drag-and-drop** way to view and manage your entire data model
- ✔ It saves time and keeps org customization organized as complexity grows
- ✔ Supports creating Objects, Fields, and Lookup/Master-Detail Relationships — all from one canvas
- ✔ Great for designing new apps, documenting architecture, and explaining data models to others
